# Brain MRI review sheet — 12 hospital exams

What the study ID is. Each study_xxxxxxxxxxxx is an anonymized code for one MRI exam. It is a hash of the DICOM Study Instance UID. It is not the patient's name, hospital ID, date of birth, or the folder name on the scanner export. Please use only this code if you refer to a case.

What this packet is. These 12 exams had FLAIR, pre-contrast T1, post-contrast T1 (T1c), and T2. Later pages are one exam each. Axial images use radiological convention: the patient's left is on your right (R on the left edge of each slice).

What the overlays are. Colored outlines are a research model's prediction, not a radiologist contour: yellow = edema, red = necrosis, blue = enhancing tumor. FLAIR pWT is the model's whole-tumor probability (warmer = more sure). QC PASS = technically usable; WARN = usable but thick slices or similar; FAIL = do not use a prediction (missing sequence or failed alignment) — no model contours are shown.

What to do. For every exam, mark tumor / no tumor / other in the box on that page, and fill the Radiologist diagnosis column below. Volumes (cm3) are model estimates for reference only.

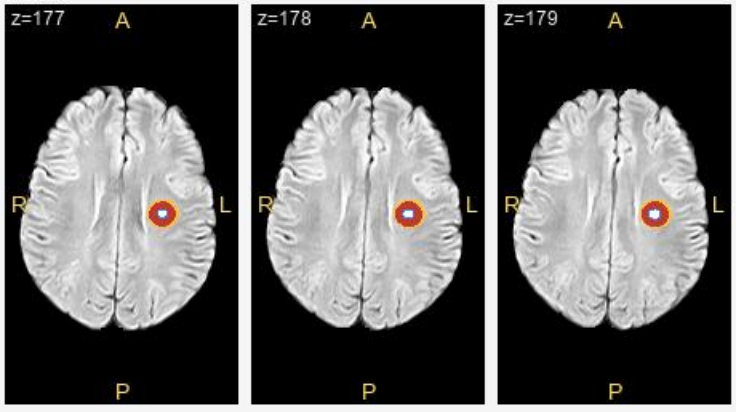

| study_id | QC | WT cm3 | TC cm3 | ET cm3 | ABC/2 | n | Radiologist diagnosis |
